

# ANTHONY ZHANG

San Diego, CA | (484) 790-9278 | [zanthony0408@gmail.com](mailto:zanthony0408@gmail.com) | [linkedin.com/in/anthony-zhang](https://www.linkedin.com/in/anthony-zhang) | [github.com/orcaquark](https://github.com/orcaquark) | [zhanganthony.com](https://zhanganthony.com)

## EDUCATION

### UC San Diego

B.S. Computer Engineering | GPA: N/A

San Diego, CA

Expected Graduation: June 2030

## ACHIEVEMENTS

**4x Competition Awards:** 2nd Place, HackStoga (100+ participants, 2026), 2nd Place, Machines · 6th Place, Astronomy · 9th Place, Circuit Lab (PA Science Olympiad States, 2026)

## EXPERIENCE

### Technical Intern

Kindred

May 2026 – Aug 2026

Boston, MA (Remote)

- Built 6 PostHog dashboards tracking user engagement, app activity, and product health metrics to support internal analysis and A/B testing
- Prototyped 3 feed formats (conversational, card deck, digest) for an AI-driven personalization feature, then shipped a thread-based version to production
- Proposed a technical architecture for Kindred Personalization, a cross-platform feed spanning a Go/Huma backend, MongoDB, and 2 frontend platforms (React Native/Expo, Tauri/React)

### Co-President

Conestoga Computer Science Club

Aug 2025 – May 2026

Berwyn, PA

- Organized a regional hackathon for 100+ tri-state students; built the signup, scheduling, and sponsor pages for partners including SIG Susquehanna and Keystone Volvo
- Secured 3 corporate partnerships via a targeted Apollo.io cold-outreach campaign of 300+ emails
- Led weekly meetings and taught core coding concepts to 15+ members
- Redesigned 3 site sections (navbar, signup, schedule) to improve mobile usability

### Research Participant

Yale Summer Program in Astrophysics

Jul 2025 – Aug 2025

New Haven, CT

- Selected 1 of 32 students nationwide; co-authored and presented the resulting research
- Developed an automated Python pipeline to extract calibrated supernova magnitudes from on-site observations and iTelescope raw data
- Improved photometric accuracy using least-squares regression against 20 reference stars
- Classified the supernova's type using a chi-squared grid search and cubic-spline interpolation to fit its light curve

## PROJECTS

### Night Sky Map: Multi-wavelength sky map | JavaScript, Aladin Lite, HiPS | [GitHub](#)

In Progress

- Building an interactive night sky map with labeled stars, constellations, deep-sky objects, planets, and a coordinate grid, using Aladin Lite as the core imagery engine
- Designing toggleable filters across different wavelengths, plus an astrophotography mode built on real space imagery

### College Planning: Tools for college transition process | HTML, CSS, JavaScript | [GitHub](#)

Active

- Built a degree-plan visualizer, deadlines checklist, and move-in checklist, fact-checking and consolidating data from multiple official UCSD sources
- Rendered a multi-year, prerequisite-audited course sequence in the visualizer, while the checklists save progress locally in the browser with color-coded, filterable categories

### GeoGuessr AI: Predicts coordinates from a photo | Python, TensorFlow, Keras | [GitHub](#)

Complete

- Trained a CNN on 10,000 image-coordinate pairs to regress geographic coordinates, reaching under 1,000 miles of average error
- Built a MessagePack-based image pipeline and applied data augmentation, dropout, and held-out validation to improve generalization and monitor training loss

## TECHNICAL SKILLS

**Languages:** Python, Java, JavaScript, HTML/CSS

**Frameworks & Libraries:** TensorFlow, Keras, NumPy, SciPy, Pandas, Matplotlib, Astropy

**Tools & Platforms:** Git/GitHub, PostHog, Apollo.io, Aladin Lite/HiPS
